APD modules

C12703 series

APD module integrated with peripheral circuits

**Features**

- Uses a high sensitivity APD
  Two types of APDs with different photosensitive areas (φ1.5 mm, φ3.0 mm) are provided.

- On-board high sensitivity circuit optimized for APD evaluation. An APD and a low-noise current-to-voltage amplifier circuit are mounted on a compact PCB board. The current-to-voltage amplifier circuit features a low-noise configuration allowing low-light-level detection.

- Detects optical signals from fixed light (DC light)
  The C12703 detects optical signals from fixed light (DC light) to 10 MHz pulsed light making it well suited for bar code readers and film scanners. The C12703-01 covers a narrower bandwidth from fixed light (DC light) to 100 kHz pulsed light, but provides an excellent NEP of 20 fW/Hz^1/2, in the room temperature, making it suitable for fluorescence measurement and particle counters where low-light-level detection is essential.

- Built-in temperature-compensated bias power supply. The bias power supply is controlled with a thermosensor to keep the APD gain constant. Gain variations are typically held within ±2.5% at an ambient temperature of 25 ±10 °C. Ripple noise usually inherent to high-voltage power supplies is also minimized.

- Compact and lightweight
  The board is no larger than a typical business card.

- Low price

- Custom designed module with different dimensions and specifications are available.

**Applications**

- Evaluation of APD
- Fluorescence measurement
- Bar code readers
- Particle counters
- Film scanners

Precaution

(1) This product incorporates a high-voltage power supply. To prevent electrical hazards, do not remove the mold material.

(2) Recommended termination resistance for this module is from 10 kΩ to 1 MΩ.

Terminating with a low-resistance resistor such as 50 Ω affects the output drive capacity, and may cause poor linearity.
