S7033/S7034 series

## Back-thinned FFT-CCD

The S7033/S7034 series are families of FFT-CCD image sensors specifically designed for low-light-level detection in scientific applications. The S7033/S7034 series feature large full-well capacity in horizontal CCD register. By using the binning operation, the S7033/S7034 series can be used as a linear image sensor having a long height. This makes the S7033/S7034 series suited for use in spectrophotometry. The binning operation offers significant improvement in S/N and signal processing speed compared with conventional methods by which signals are digitally added by an external circuit.

The S7033/S7034 series have an effective pixel size of  $24 \times 24 \mu\text{m}$  and are available in image areas ranging from  $12.288 \text{ (H)} \times 2.928 \text{ (V)} \text{ mm}^2$  (S7033-0907, S7034-0907S) up to a large image area of  $24.576 \text{ (H)} \times 2.928 \text{ (V)} \text{ mm}^2$  (S7033-1007, S7034-1007S).

Either one-stage or two-stage thermoelectric cooler is built into the package (S7034/S7035 series). At room temperature operation, the device can be cooled down to  $-10 \text{ }^\circ\text{C}$  by one-stage cooler and  $-30 \text{ }^\circ\text{C}$  by two-stage cooler respectively without using any other cooling technique. In addition since both the CCD chip and the thermoelectric cooler are hermetically sealed, no dry air is required, thus allowing easy handling.

### Features

- Line, pixel binning
- Greater than 90 % quantum efficiency at peak sensitivity wavelength
- Wide spectral range
- Wide dynamic range
- MPP operation
- Built-in thermoelectric cooler (S7034/S7035 series)

### Applications

- Fluorescence spectrometer, ICP
- Industrial inspection requiring
- Semiconductor inspection
- DNA sequencer
- Low-light-level detection

Note: When viewed from the direction of the incident light, the horizontal shift register is covered with a thick silicon layer (dead layer). However, long-wavelength light passes through the silicon dead layer and may possibly be detected by the horizontal shift register. To prevent this, provide light shield on that area as needed.

Internal resistance	Rint	Ta=25 °C	2.5	1.2	$\Omega$
Maximum current *22	Imax	Tc *23=Th *24=25 °C	1.5	3.0	A
Maximum voltage	Vmax	Tc *23=Th *24=25 °C	3.8	3.6	V
Maximum heat absorption *25	Qmax		3.4	5.1	W
Maximum temperature of heat radiating side	-		70	70	°C

\*22: If the current greater than this value flows into the thermoelectric cooler, the heat absorption begins to decrease due to the Joule heat. It should be noted that this value is not the damage threshold value. To protect the thermoelectric cooler and maintain stable operation, the supply current should be less than 60 % of this maximum current.

\*23: Temperature of the cooling side of thermoelectric cooler

\*24: Temperature of the heat radiating side of thermoelectric cooler

\*25: This is a theoretical heat absorption level that offsets the temperature difference in the thermoelectric cooler when the maximum current is supplied to the unit.

**Specifications of built-in temperature sensor**

A chip thermistor is built in the same package with a CCD chip, and the CCD chip temperature can be monitored with it. A relation between the thermistor resistance and absolute temperature is expressed by the following equation.

$$R_{T1} = R_{T2} \times \exp B_{T1/T2} (1/T1 - 1/T2)$$

$R_{T1}$ : resistance at absolute temperature T1 [K]

$R_{T2}$ : resistance at absolute temperature T2 [K]

$B_{T1/T2}$ : B constant [K]

The characteristics of the thermistor used are as follows.

$R_{298}=10\text{ k}\Omega$

$B_{298/323}=3450\text{ K}$

**Precaution for use (electrostatic countermeasures)**

- Handle these sensors with bare hands or wearing cotton gloves. In addition, wear anti-static clothing or use a wrist band with an earth ring, in order to prevent electrostatic damage due to electrical charges from friction.
- Avoid directly placing these sensors on a work-desk or work-bench that may carry an electrostatic charge.
- Provide ground lines or ground connection with the work-floor, work-desk and work-bench to allow static electricity to discharge.
- Ground the tools used to handle these sensors, such as tweezers and soldering irons.

It is not always necessary to provide all the electrostatic measures stated above. Implement these measures according to the amount of damage that occurs.

**Element cooling/heating temperature incline rate**

Element cooling/heating temperature incline rate should be set at less than 5 K/min.
